

90-DAY SOFTWARE TESTING CAREER ROADMAP

Module 6 Assignment — API Testing with Postman

Assignment brief: scenario, deliverables, steps and how your work is assessed.

About this assignment

A feature depends on a REST API and you need to verify it directly — faster and more stable than testing only through the UI.

What you'll demonstrate

- Test GET/POST/PUT/DELETE requests
- Assert status and key response fields
- Cover error/negative cases

What to submit

- 10 API test cases against a public API (e.g. reqres.in, jsonplaceholder)
- A Postman collection export (JSON)
- Evidence of 3 successful and 2 error responses

Step-by-step

1. Pick a public REST API and explore its endpoints
2. Create requests covering GET/POST/PUT/DELETE
3. Add assertions on status and key body fields, plus error cases
4. Export the collection and capture evidence

Submission format

Submit the Postman collection (JSON) plus test case documentation as PDF or DOCX.

How your work is assessed

If a QA lead reviewed this, they would look for:

- Meaningful assertions on body and status
- Negative/error cases included
- Realistic, valid request data
- Collection organised and exported

Templates & resources to use

- Test Scenario Template — find it in the Resource Vault.

INSIDE STLC PRO TIP

Assert the response body, not just the status — a "200 OK" with the wrong body is still a bug, and checking it shows real API-testing skill.
