

90-DAY SOFTWARE TESTING CAREER ROADMAP

Module 7 Assignment — SQL for Testers

Assignment brief: scenario, deliverables, steps and how your work is assessed.

About this assignment

A reported total looks wrong and the UI may be hiding the truth. You need SQL to verify what the system actually stored and to set up test data.

What you'll demonstrate

- Write SELECT/WHERE/JOIN and aggregate queries
- Use SQL to validate data
- Explain how SQL supports testing

What to submit

- 20 SQL queries covering SELECT, WHERE, ORDER BY, GROUP BY and JOIN
- 5 data-validation examples
- 3 short explanations of how SQL helps you as a tester

Step-by-step

1. Use a sample schema (or a free SQL sandbox)
2. Write the 20 queries, each with a one-line note on what it verifies
3. Show 5 examples of validating data with SQL
4. Write 3 short reflections on SQL in testing

Submission format

Submit as a PDF or DOCX, queries grouped by type with their purpose.

How your work is assessed

If a QA lead reviewed this, they would look for:

- Correct use of SELECT/WHERE/JOIN/aggregates

- Queries tied to a testing purpose
- At least one join and one aggregation
- Queries that would actually run

Templates & resources to use

- Requirements Traceability Matrix (RTM) — find it in the Resource Vault.
- Software Testing Glossary — find it in the Resource Vault.

INSIDE STLC PRO TIP

Frame each query around what it verifies (a total, data integrity, a user's records) — that connects SQL to real QA value, not just syntax.
