

AI FOR QA TESTERS

Module 8 Assignment — API Testing with AI

Assignment brief: scenario, deliverables, steps and how your work is assessed.

About this assignment

You are handed an unfamiliar API. You will use AI to understand it and generate test ideas, then verify everything against the real API before relying on it.

What you'll demonstrate

- Use AI to understand endpoints
- Generate API test ideas including error cases
- Verify AI output against the real API

What to submit

- 8 API test ideas (method, purpose, expected result) for a public API
- A note of any AI suggestion you had to correct

Step-by-step

1. Pick a public API and ask AI to explain key endpoints
2. Generate test ideas including negative/error cases
3. Verify fields and status codes against the real docs
4. Record any inaccuracies you corrected

Submission format

Submit as a PDF or DOCX.

How your work is assessed

If a QA lead reviewed this, they would look for:

- Good test ideas including error cases
- Details verified against the real API
- Risk thinking (auth, validation, exposure)
- Hallucinated fields caught

Templates & resources to use

- AI Prompt Library (100 Prompts) — find it in the Resource Vault.

INSIDE STLC PRO TIP

Confirm specifics (field names, status codes) against the real docs before building tests on them — AI can invent plausible-sounding fields.
