

90-DAY SOFTWARE TESTING CAREER ROADMAP

Module 2 Assignment — Test Design Techniques

Assignment brief: scenario, deliverables, steps and how your work is assessed.

About this assignment

Your team needs test cases for a new feature and your lead wants to see that you design coverage deliberately using recognised techniques — not by clicking around.

What you'll demonstrate

- Apply equivalence partitioning and boundary value analysis
- Use a decision table and/or state transition where relevant
- Write clear, repeatable test cases

What to submit

- A test case pack (10+ cases) for a feature of your choice
- Each case annotated with the technique it uses

Step-by-step

1. Choose a feature with a few inputs and rules
2. Derive partitions and boundary values for each input
3. Build a decision table or state diagram if behaviour depends on combinations/states
4. Write the test cases (title, steps, data, expected result) and tag each with its technique

Submission format

Submit as a PDF or DOCX (or spreadsheet) — a clear, structured test case pack.

How your work is assessed

If a QA lead reviewed this, they would look for:

- Techniques named and applied correctly
- Both valid and invalid/edge cases covered
- Specific, verifiable expected results
- No vague "it works" outcomes

Templates & resources to use

- Test Case Template — find it in the Resource Vault.
- Software Testing Glossary — find it in the Resource Vault.

INSIDE STLC PRO TIP

Annotating which technique each case uses turns a list of tests into evidence that you think about coverage — exactly what a reviewer wants to see.
