

90-DAY SOFTWARE TESTING CAREER ROADMAP

Module 8 Assignment — Automation Fundamentals

Assignment brief: scenario, deliverables, steps and how your work is assessed.

About this assignment

Your team is considering automation and wants your judgement on what to automate — and what to keep manual — with clear reasoning.

What you'll demonstrate

- Decide what to automate using sound criteria
- Apply the test pyramid (right layer)
- Justify each decision

What to submit

- A review of 10 tests
- For each: automate or keep manual, the layer, and your reasoning (frequency, stability, value, maintenance)

Step-by-step

1. List 10 tests from earlier modules
2. For each, decide automate/manual and at which layer
3. Justify the decision against frequency, stability, value and maintenance cost
4. Summarise your overall automation approach

Submission format

Submit as a PDF or DOCX using the provided template.

How your work is assessed

If a QA lead reviewed this, they would look for:

- Sensible automate/not-automate decisions with reasons
- Awareness of the pyramid (right layer)
- No "automate everything" without reasoning
- Decisions justified by risk and ROI

Templates & resources to use

- Test Strategy Template — find it in the Resource Vault.

INSIDE STLC PRO TIP

Knowing what NOT to automate (volatile, one-off, exploratory) is as important as what to automate — say so explicitly.
