

PRACTICAL TEST AUTOMATION WITH PLAYWRIGHT

Automation Portfolio Project Workbook

Build a public Playwright project that proves you can automate.

Introduction

A public automation project is the single most convincing proof that you can do the job. This workbook guides you to build, document and present a Playwright project employers will take seriously.

What to Build

- Pick a public demo app (e.g. a demo shop or todo app).
- Automate 8-12 meaningful tests across key journeys.
- Include UI tests, at least one API test, and a page object.
- Wire it up to run in GitHub Actions.

Step-by-Step

1. Set up a clean Playwright + TypeScript project.
2. Write tests for the main journeys (one behaviour each, robust locators).
3. Add page objects and a fixture for shared setup.
4. Add an API test and use API setup for one UI test.
5. Add a GitHub Actions workflow with report upload.
6. Write a clear README: what it tests, how to run it, what it demonstrates.
7. Push to GitHub (public) and confirm CI is green.

README Checklist

- One-paragraph overview of the project and app under test
- How to install and run the tests
- What is covered and why (your test strategy)
- Tech used (Playwright, TypeScript, CI)
- A note on what it demonstrates about your skills

Self-Review Checklist

- Tests are reliable (pass on repeat runs)
- Locators are user-facing and robust
- Code is clean and consistent
- CI is green and report uploads
- README is clear and the repo is public

Practical Exercise

Build the project to the checklists above, then prepare a 60-second walkthrough explaining what it demonstrates about you.

Common Mistakes

- A private repo or broken CI a reviewer cannot see.
- Lots of trivial tests instead of meaningful journeys.
- No README, so the work has no context.

INSIDE STLC PRO TIP

A public Playwright repo with green CI and a clear README does more for your job hunt than any certificate. It lets an employer see exactly how you think and code.
