

PRACTICAL TEST AUTOMATION WITH PLAYWRIGHT

Module 11 Assignment — Framework Maintenance

Assignment brief: scenario, deliverables, steps and how your work is assessed.

About this assignment

You are handed an intentionally poor or flaky framework. You will diagnose and fix it, proving reliability — without papering over problems with retries.

What you'll demonstrate

- Diagnose flaky tests
- Fix the root cause
- Prove reliability

What to submit

- A fixed flaky/poor test
- A before/after: the diagnosis (checklist + trace), the fix, and a repeat-each run proving stability

Step-by-step

1. Reproduce the flakiness with --repeat-each
2. Use the checklist and trace to find the root cause
3. Fix it (remove sleeps/brittleness; make data independent)
4. Re-run repeatedly to confirm it is stable

Submission format

Submit as a PDF or DOCX, documenting before and after.

How your work is assessed

If a QA lead reviewed this, they would look for:

- Root cause found, not masked
- Sleeps/brittleness removed
- Reliability proven by repeat-each
- No retries used to hide flakiness

Templates & resources to use

- Flaky Test Troubleshooting Checklist — find it in the Resource Vault.

INSIDE STLC PRO TIP

A test you cannot make fail reliably is one you cannot prove you have fixed — run `--repeat-each` to expose flakiness on demand.
