

PRACTICAL TEST AUTOMATION WITH PLAYWRIGHT

Module 5 Assignment — Page Object Model

Assignment brief: scenario, deliverables, steps and how your work is assessed.

About this assignment

Your suite is growing and locators are repeating. You will introduce page objects so changes happen in one place and tests read clearly.

What you'll demonstrate

- Design clean page objects
- Separate actions from assertions
- Refactor tests to use them

What to submit

- Page objects for Login, Dashboard, Shopping Basket and Checkout
- A test refactored to use them, showing how it reads

Step-by-step

1. Create a page object per page with intent-revealing methods
2. Keep locators encapsulated; assertions in the test
3. Refactor your tests to use the page objects
4. Note how much cleaner the tests read

Submission format

Submit as a PDF/DOCX or a repository link.

How your work is assessed

If a QA lead reviewed this, they would look for:

- Intent-revealing methods, encapsulated locators
- Assertions in the test, not the page object
- One page object per page
- Tests read clearly

Templates & resources to use

- Page Object Model (POM) Template — find it in the Resource Vault.

INSIDE STLC PRO TIP

Name methods after what the user does, not what the code does — `addToBasket()` reads better than `clickAddButton()` and survives UI changes.
