

PRACTICAL TEST AUTOMATION WITH PLAYWRIGHT

Module 6 Assignment — Test Data Management

Assignment brief: scenario, deliverables, steps and how your work is assessed.

About this assignment

Your tests must be reliable and repeatable. You will manage test data so each test owns its data and runs in any order.

What you'll demonstrate

- Generate unique, valid data
- Use a data file and a factory
- Keep tests data-independent

What to submit

- A factory that generates unique valid records
- One JSON or CSV data set driving a parameterised test
- A test shown creating and cleaning up its own data

Step-by-step

1. Write a factory returning a valid record with a unique email
2. Move a data set into JSON/CSV and drive a parameterised test
3. Make a test create and clean up its own data
4. Run it twice to confirm independence

Submission format

Submit as a PDF/DOCX or a repository link.

How your work is assessed

If a QA lead reviewed this, they would look for:

- Unique, valid generated data
- Data file driving a parameterised test
- Self-cleaning, order-independent tests
- No secrets in code

Templates & resources to use

- Test Data Management Template — find it in the Resource Vault.

INSIDE STLC PRO TIP

A reliable test passes alone or with others, in any order, any number of times. If yours pass solo but fail together, data coupling is the cause.
