

PRACTICAL TEST AUTOMATION WITH PLAYWRIGHT

Module 8 Assignment — API Automation

Assignment brief: scenario, deliverables, steps and how your work is assessed.

About this assignment

Not everything needs the browser. You will automate a public REST API and use API calls to set up state for a UI test.

What you'll demonstrate

- Automate REST API tests with Playwright
- Validate status and response bodies
- Use the API to seed a UI test

What to submit

- At least five API tests (GET/POST and an error case), asserting status and key fields
- One UI test that uses an API call to set up its starting state

Step-by-step

1. Use the request fixture to test a public API
2. Assert status and meaningful body fields, plus an error case
3. Create data via the API to seed a UI test
4. Keep credentials in environment variables

Submission format

Submit as a PDF/DOCX or a repository link.

How your work is assessed

If a QA lead reviewed this, they would look for:

- Meaningful assertions on body and status
- A negative/error case included

- API-driven setup for the UI test
- No hard-coded secrets

Templates & resources to use

- [API Testing with Playwright Template](#) — find it in the Resource Vault.

INSIDE STLC PRO TIP

The fastest UI tests do their setup via the API — reserve the UI for the behaviour you are actually testing.
