

AI FOR QA TESTERS

AI Risk Assessment Checklist

Run this before using AI on any real QA task.

Introduction

AI brings real risks — data exposure, hallucination, bias and over-reliance. This quick checklist helps you use it safely on each task.

Pre-Use Checklist

- Is the tool approved for this type of data?
- Have I removed/anonymised any sensitive or customer data?
- Do I have a way to verify the output?
- Am I using AI to draft/assist, not to make a quality decision?
- Will I review and own the result?
- Does this comply with company policy?

Worked Example

Before asking AI to analyse a defect, you confirm the tool is approved, swap the real customer email for a dummy one, and plan to verify the steps against the app — all six checks pass, so you proceed safely.

Practical Exercise

Apply the checklist to a real task you would use AI for. If any item fails, rework the task until it passes.

Best Practices

- Make the checklist a habit before every AI task.
- When unsure about data, leave it out.
- Prefer approved/enterprise tools for sensitive work.

Common Mistakes

- Skipping the data check "just this once".

- No plan to verify the output.
- Letting AI make the call instead of you.

INSIDE STLC PRO TIP

A simple test: "Would I be comfortable if this prompt were public?" If not, do not send it.
