

AI FOR QA TESTERS

AI Test Case Review Checklist

Review AI-generated test cases like a professional.

Introduction

AI can draft test cases fast, but the value is in your review. This checklist helps you turn an AI draft into a strong, trustworthy test set.

Review Checklist

- Are expected results specific and verifiable (not "it works")?
- Did it invent any rules or behaviour that do not exist?
- Are negative and boundary cases covered, not just the happy path?
- Any duplicates or overlapping cases to merge?
- Is the test data realistic and valid for the field rules?
- Are cases independent and focused on one behaviour each?
- Is each case prioritised by risk?

Worked Example

A generated case asserts a "loyalty points" message that no feature provides — a hallucination you remove. You also add boundary cases for the 8–20 character password the draft missed.

Practical Exercise

Generate test cases for a feature, review them against this checklist, and note at least two issues you found and fixed.

Best Practices

- Apply equivalence partitioning and boundary analysis to judge coverage.
- Tighten vague expected results.
- Prioritise by risk before use.

Common Mistakes

- Shipping AI cases without checking expected results.
- Keeping every generated case regardless of value.
- Missing hallucinated requirements.

INSIDE STLC PRO TIP

Anyone can generate test cases; a professional catches the wrong and missing ones. Your review is the value-add.
