

AI FOR QA TESTERS

Personal AI Toolkit Planner

Build your own repeatable AI-assisted testing toolkit.

Introduction

The testers who get the most from AI build a personal toolkit: their best prompts, their go-to tools, and their own rules. This planner helps you assemble yours so you work faster and more consistently.

Instructions

- Capture the prompts that work well for you as you go.
- Note which tool you use for which task.
- Write your own usage rules and keep refining them.
- Review and prune your toolkit monthly.

Worked Example

A tester keeps a note with five saved prompts (test design, bug report review, requirement review, data generation, explain-a-concept), a one-line rule ("never paste real data"), and a tool-per-task list. Each new task starts from a proven prompt instead of a blank box.

Blank Reusable Template

Task	My go-to prompt	Tool	Notes
Test design			
Bug report review			
Requirement review			
Test data			
Learning / explain			

My Personal Rules

- Data I will never share:
- How I verify output:
- When I will NOT use AI:
- How I record AI-assisted work:

Practical Exercise

Fill in the table with at least three saved prompts you have used successfully, and write your four personal rules. Revisit it after two weeks and improve one prompt.

Best Practices

- Save prompts that work — do not rewrite from scratch each time.
- Keep one place for your toolkit.
- Refine continuously as tools change.

Common Mistakes

- Reinventing prompts every time.
- No personal data/safety rules.
- Letting the toolkit go stale.

INSIDE STLC PRO TIP

Your prompt library is a career asset. The tester who walks into a new job with a proven AI toolkit ramps up far faster than one starting from zero.
