

AI FOR QA TESTERS

AI Validation Checklist

A consistent way to validate any AI-generated QA output before you use it.

Introduction

AI drafts; you validate. This checklist gives you a repeatable validation step so AI output reaches the same quality bar as work you produced yourself.

Validation Checklist

- Accuracy: are the facts, rules and expected results correct?
- Relevance: does it fit this product and context?
- Completeness: are edge/negative cases and key scenarios covered?
- No hallucinations: nothing invented or unverifiable?
- Safety: no sensitive data was used?
- Ownership: I have reviewed it and can stand behind it.

Worked Example

For AI-generated test cases you confirm the expected results are correct, add a missing "expired link" case from your own knowledge, and remove one irrelevant case — then they are ready to use.

Practical Exercise

Take one AI-generated artefact and run it through all six checks. Record what you accepted, changed and rejected.

Best Practices

- Treat AI output like work from a junior — helpful, but verify it.
- Use your QA techniques to judge coverage.
- Document your review where it matters.

Common Mistakes

- Validating only the format, not the facts.
- Assuming completeness because it looks thorough.
- No record of what was AI-assisted.

INSIDE STLC PRO TIP

"AI drafts, I validate and own it" is the professional standard. Make validation a non-negotiable step.
